

## Inventory Control / Proposed business setup scheme for parts locations

Inventory control down to the bin level will be extremely helpful in the stock room or warehouse. This will primarily aid in the storage and retrieval on an item because the system can indicate to the warehouse clerk the precise bin location of an item.

Inventory control by location requires that when an item is transferred from one location to another, the computer must be informed of the transfer, otherwise the inventory quantity at each location will be inaccurate. Strict operational control must be observed for the integrity of the database. This leads to a slight delay in the physical transferring of merchandise between locations. But this slight delay far outweighs the benefits which results from this type of inventory control. Checkmate will now be able to tell you the exact inventory count per location. Any variance between the physical count and the inventory count given by computer means the merchandise has been lost. Management can now be aware of the problem locations and take preventive countermeasures to avoid leakage of the merchandise.

### Numbering setup Scheme

A numbering setup scheme will allow retrieval of parts from a location by the identifying shelf location. Six alphanumeric characters will describe the physical location, section number, and shelf within the section. All parts on a shelf will share the same section number but will have a different shelf number within the section. The section number will be displayed on the end of each section. Examples: A. we recommend filling the sections by starting at the lower left corner and moving across to the right, using a serpentine pattern through the shelf. Shown in the below shelf examples.

A01001 Each part of the number scheme is explained below.

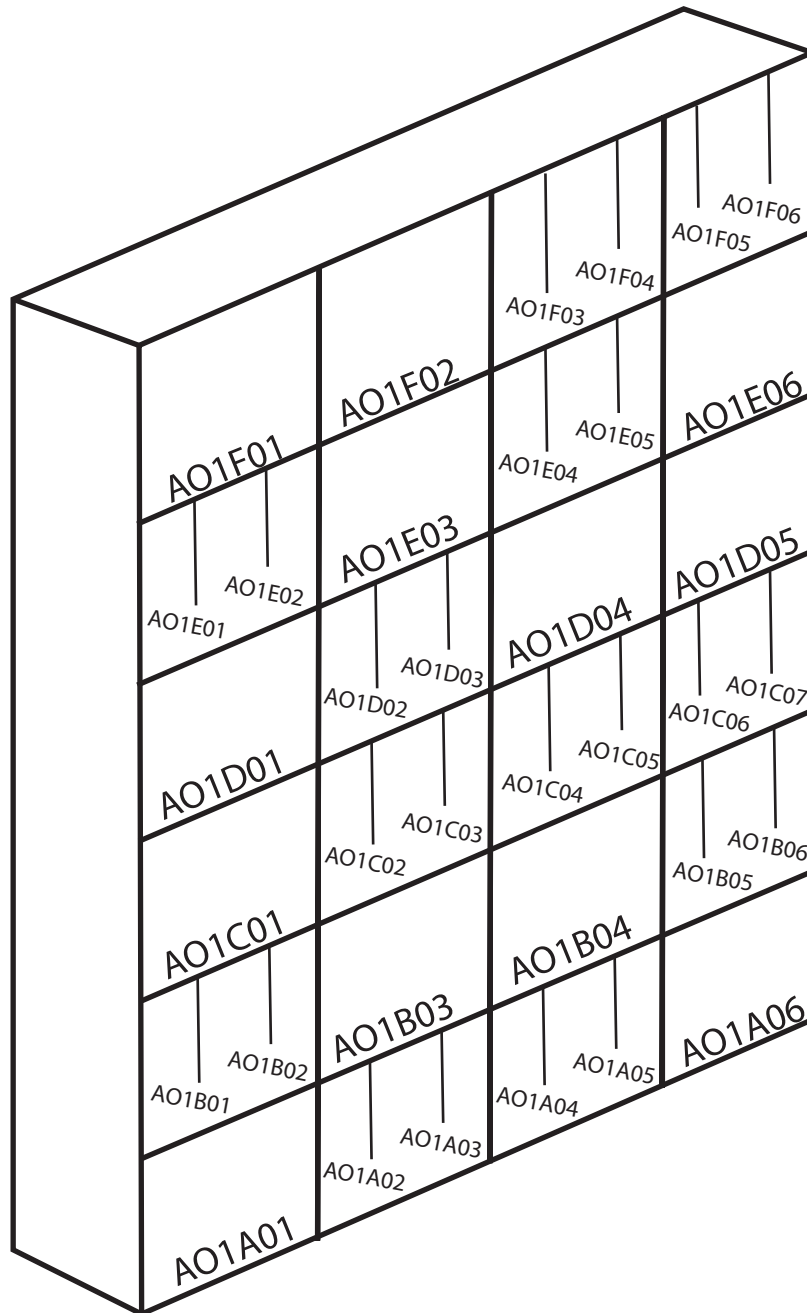

NUMBER	IDENTIFIES	NOTES
A	Building	One digit for a building will allow a business to direct the material handler to a given building to retrieve a part. For example, if your business were to add a second building it would be labeled B.
01	Section	Two digits for a section will direct you to the exact section within the building.
001	Shelf	Shelf 001 is the bottom shelf. Shelf 021 is the top shelf, designated for materials. See below example of a typical shelf setup.

In the case of yard locations, the shelf number has no significance.

# Shelf Example

A01001	A01002	A01003	A01004
A01005	A01006	A01007	A01008
A01009	A01010	A01011	A01012
A01013	A01014	A01015	A01016
A01017	A01018	A01019	A01020
A01021	A01022	A01023	A01024

NUMBER	IDENTITIES	NOTES
A	Building	One digit for a building will allow a business to direct the material handler to a given building to retrieve a part. For example, if your business were to add a second building it would be labeled B.
01	Row	Two digits will direct you to the exact row within the building.
A	Shelf	Shelf A is the bottom shelf. Shelf F is the top shelf designated for materials. See below example of a typical shelf setup.
01	Location	Two digits for a location will direct you to the exact location within the shelf.
